The Metropolis algorithm applied to the combinatorial optimization problem can be summarized as:

1. Initialization: $n = 0$, $T \neq T_{\max}$ (system is "melted"); select an initial $x(0)$ at random.
2. Generate new candidate $x(n+1)$ at random by a small perturbation of $x(n)$.
3. Compute $\Delta\text{Cost} = \text{Cost}(x(n+1)) - \text{Cost}(x(n))$.
4. (a) $\Delta\text{Cost} \leq 0$: accept x
