The series of processes that change one type of rock into another type of rock is called the rock cycle. Forces on Earth's surface and deep within Earth drive the rock cycle. The cycle describes how natural processes work to change one rock type into another rock type. One example is igneous rock that begins as lava.

C126 001 004 RE L1 889407

The rock cycle is driven by two forces: (1) Earth's internal heat engine, which moves material around in the core and the mantle and leads to slow but significant changes within the crust, and (2) the hydrological cycle, which is the movement of water, ice, and air at the surface, and is powered by the sun.

4 Section 1 The Rock Cycle - Glencoe/McGraw-Hill

The series of processes that continually change one rock type into another is called the rock cycle. As materials move through the rock cycle, they can take the form of igneous rocks, sedimentary rocks, or metamorphic rocks. At times, the material might not be rock at all. It might be sediment, magma, or lava.

Minerals and Rocks - Somerset Canyons

if the rock gets hot enough to melt it might create magma that eventually cool to form igneous rock Rock Cycle

The rock cycle is a continuous series of steps. For example: when igneous rock undergoes weathering and erosion it becomes sediment. Then, when that sediment undergoes compaction and cementation it becomes sedimentary rock. If that sedimentary rock becomes pressed together by heat and pressure, it can turn into metamorphic rock.

Oxygen Cycle Most of the earth's oxygen is contained within the rock materials of the earth's crust and mantle. A very small amount of free oxygen exists in either the biosphere or atmosphere. The greatest source of atmospheric oxygen is plant photosynthesis which produces sugars and oxygen from carbon dioxide and water.

Failure of gluconeogenesis is usually fatal. Hypoglycemia causes brain dysfunction, which can lead to coma and death. Glucose is also important in maintaining adequate concentrations of intermediates of the citric acid cycle (see Chapter 16) even when fatty acids are the main source of acetyl-CoA in the tissues. In addition, gluconeogenesis clears lactate produced by muscle and erythrocytes ...
